THERAPEUTICS

Corporate Presentation

March 2024

Disclaimer

Statements contained in this presentation regarding matters that are not historical facts are "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995, as amended. Words such as "anticipates," "believes," "expects," "intends," "plans," "potential," "projects," "would" and "future" or similar expressions are intended to identify forward-looking statements. Examples of these forward-looking statements include statements concerning: Keros' expectations regarding its growth, strategy, progress and the design, objectives, expected results and timing of its preclinical studies and clinical trials for KER-050, KER-012 and KER-065, including its regulatory plans; the potential of Keros' proprietary discovery approach; and the potential of KER-065 to treat obesity without an associated loss of muscle and potential for frailty, both as a monotherapy and in combination with GLP-1 receptor agonists. Because such statements are subject to risks and uncertainties, actual results may differ materially from those expressed or implied by such forward-looking statements. These risks and uncertainties include, among others: Keros' limited operating history and historical losses; Keros' ability to raise additional funding to complete the development and any commercialization of its product candidates; Keros' dependence on the success of its product candidates, KER-050, KER-012 and KER-065; that Keros may be delayed in initiating, enrolling or completing any clinical trials; competition from third parties that are developing products for similar uses; Keros' ability to obtain, maintain and protect its intellectual property; and Keros' dependence on third parties in connection with manufacturing, clinical trials and preclinical studies.

These and other risks are described more fully in Keros' filings with the Securities and Exchange Commission ("SEC"), including the "Risk Factors" section of the Company's Annual Report on Form 10-K, filed with the SEC on February 28, 2024, and its other documents subsequently filed with or furnished to the SEC. All forward-looking statements contained in this presentation speak only as of the date on which they were made. Except to the extent required by law, Keros undertakes no obligation to update such statements to reflect events that occur or circumstances that exist after the date on which they were made.

Certain information contained in this presentation relates to or is based on studies, publications, surveys and other data obtained from third-party sources and the Company's own internal estimates and research. While we believe these third-party sources to be reliable as of the date of this presentation, it has not independently verified, and makes no representation as to the adequacy, fairness, accuracy or completeness of, any information obtained from third-party sources. Finally, while we believe our own internal research is reliable, such research has not been verified by any independent source.

Focused on Transforming the Lives of a Wide Range of Patients with Disorders Linked to Dysfunctional TGF-β Superfamily Signaling

Keros is a clinical-stage biopharmaceutical company

Developing potentially differentiated product candidates designed to alter transforming growth factor-beta (TGF- β) signaling and target pathways critical for the growth, repair and maintenance of a number of tissue and organ systems We believe our product candidates have the potential to unlock the full therapeutic benefits of modulating the TGF-β superfamily and provide disease-modifying benefit to patients

Corporate Presentation

Imbalanced TGF-β Signaling in Bone Marrow Results in Ineffective Hematopoiesis and Poor Outcomes in Both MDS and MF^{1,2,3}

1. Verma A, et al. J Clin Inv 2020; 2. Portale F, et al., Haematologica. 2019, 3. Rambaldi B., et al, Ann Hematol. 2021 BMP = bone morphogenetic protein; GDF = growth differentiation factor

KER-050 (elritercept)

Investigational Treatment for Anemia and Thrombocytopenia in Patients with Myelodysplastic Syndromes

Ongoing Phase 2 Clinical Trial of KER-050 for the Treatment of Anemia in Patients with Very Low-, Low- or Intermediate-Risk Myelodysplastic Syndromes

s = 4

Myelodysplastic Syndromes (MDS)

MDS

MDS is a collection of bone marrow disorders characterized by ineffective hematopoiesis and peripheral cytopenias.

Clinical Consequences

The clinical consequences of MDS include anemia, bleeding, iron overload, cardiovascular disease and progression to acute myeloid leukemia (AML).

Survival Ranges

Median survival ranges from approximately nine years for very low-risk patients to less than a year for high-risk patients.

Scope

In the United States, there are 60,000 to 170,000 patients living with MDS and 15,000 to 20,000 new cases of MDS reported each year.

Progressive disease Cytopenias including leading to AML and severe anemia cardiovascular disease

Impact of MDS

Created with BioRender

Severe fatigue and decreased quality of life

Current Treatment Landscape for Treatment of Anemia in Lower-Risk MDS

Red Blood Cell (RBC) Transfusions

- RBC transfusions provide symptomatic relief of anemia
- Transfusion dependency is associated with iron overload, further exacerbating damage to the bone marrow and increasing risk of AML progression and cardiovascular disease
- Prolonged transfusion dependence is associated with shorter overall survival

Erythroid Stimulating Agents (ESAs)

 ESAs are currently first line treatment of choice but response is limited in patients with endogenous erythropoietin levels (>200 U/L) and high transfusion burden (>4 units of RBC/8 weeks)

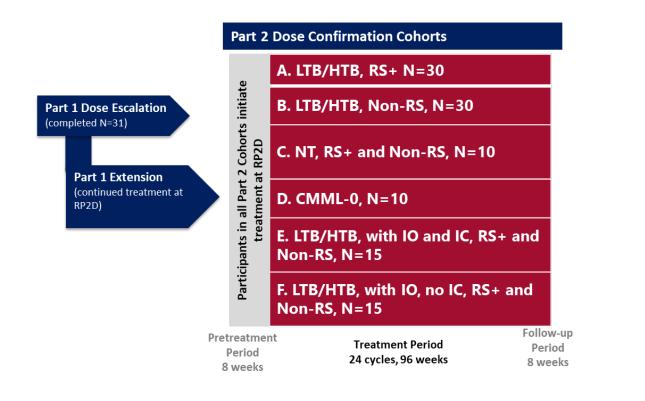

Erythroid Maturation Agent

- Reblozyl[®] approved in 1st and 2nd line MDS
- In second-line treatment, only 20% of high transfusion burden (HTB) patients achieved 8-week transfusion independence with Reblozyl[®] versus 4% with placebo¹
- In second-line setting, a medical reviewer of luspatercept noted "patient reported outcome (PRO) data showed no improvement in quality of life for patients who received luspatercept or who responded to luspatercept."²

Unmet need remains for treatment that can address the multifaceted pathophysiology of MDS

1. Femaix P, et al. New Eng J Med 2020; 382:140-151; 2. Lspatercept FDA review document Page 11 4/3/2020.

Ongoing Phase 2 Clinical Trial of KER-050 for the Treatment of Anemia in Patients with Very Low-, Low- or Intermediate-Risk MDS

Response data are presented for the modified intent to treat 24-week population (mITT₂₄) that includes RP2D participants with at least 24 weeks of KER-050 treatment or who have discontinued (n=60)

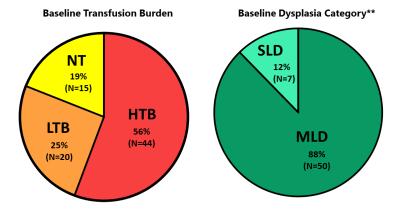

Data are presented as of a data cutoff date of September 1, 2023.

*9 RP2D patients had missing baseline erythropoietin (EPO); **Excludes 22 RP2D participants with unknown dysplasia category

RP2D = Recommended Part 2 Dose of 3.75 mg/kg with the ability to titrate to 5 mg/kg once every four weeks; CMML: chronic myelomonocytic leukemia; high transfusion burden (HTB): \geq 4 units of RBC/8 weeks for hemoglobin (Hgb) \leq 9 g/dL; low transfusion burden (LTB): 1-3 units of RBC/8 weeks for Hgb \leq 9 g/dL; non-transfused (NT): Hgb \leq 10 g/dL; RS = ring sideroblasts.; IO = Iron Overload; IC = Iron Chelation, SLD = Single Lineage Dysplasia, MLD = Multi Lineage Dysplasia

Baseline Demographics

Baseline Characteristic	RP2D (N=79)
Median age, years (range)	75 (53, 89)
Sex, male, n (%)	50 (63.3)
Hemoglobin, g/dL, median (range)	8.37 (3.7, 10.5)
RS+, n (%)	57 (72.2)
Non-RS, n (%)	22 (27.8)
Prior ESA, n (%)	21 (26.6)
Median baseline EPO level, U/L (range)*	127.8 (1, 4000)
Thrombocytopenia, n (%) (platelets < 150 x 10º/L)	20 (25)

KER-050 was Generally Well-tolerated

Most frequent TEAEs (≥ in 15% of patients) regardless of causality were:

- Dyspnea or diarrhea (18; 22.8% each)
- ► Fatigue (16; 20.3%)
- Nausea (15; 19.0%)
- ► Headache (12; 15.2%)

Most TEAEs were mild (Grade 1) to moderate (Grade 2)

3 treatment-related TESAEs of injection site reaction (Grade 2), dyspnea (Grade 3), and syncope (Grade 3) occurred in 1 patient each

Dyspnea and syncope were assessed as not related to study treatment by the Sponsor due to underlying co-morbidities

Fatal TESAEs (cardiac failure and myocardial infarction) occurred in 2 (2.5%) patients; both were assessed as unrelated by the PI and Keros

No patients progressed to AML

Category	RP2D (N=79) n (%)
Any TEAE	74 (93.7)
Any treatment-related TEAE	33 (41.8)
Any TESAE	28 (35.4)
Any treatment-related TESAE	3 (3.8)
Any TEAE leading to death	2 (2.5)
Any TEAE leading to KER-050 discontinuation*	11 (13.9)

*Treatment-related TEAEs leading to KER-050 discontinuation: injection site reaction, platelet count increased, and dyspnea

Unrelated TEAEs leading to KER-050 discontinuation: nodular melanoma, NSCLC, MI, dementia Alzheimer's type, dyspnea, cardiac failure, and COPD & cardiac failure congestive (both in 1 patient)

Treatment-related = considered to be related to the study treatment by the treating investigator. Number and percent of patients with events were summarized.

Data are presented as of a data cutoff date of September 1, 2023.

AML = acute myeloid leukemia; COPD = chronic obstructive pulmonary disease; MI = myocardial infarction; NSCLC = non-small cell lung cancer; TEAE = treatment emergent adverse event; TESAE = treatment emergent serious adverse event

Hematologic Responses Observed in Broad Array of Patients Treated with KER-050

Responders/N (%)	mITT ₂₄		
Responders/N (70)	All (N=60)	HTB (N=33)	
Overall Response ^{a,b}	30/60 (50)	15/33 (45.5)	
Modified IWG 2006 HI-E ^c	28/60 (47)	15/33 (45.5)	
RS+	23/40 (58)	12/23 (52.2)	
non-RS	5/20 (25)	3/10 (30)	
TI ≥8 weeks ^d	18/46 (39.1)	11/33 (33.3)	
RS+	15/32 (46.9)	8/23 (34.8)	
non-RS	3/14 (21.4)	3/10 (30)	

HI-E and transfusion independence (TI) response rates in mITT₂₄ patients with HTB were similar to those observed in the overall mITT₂₄ population, supporting the potential for KER-050 to treat a broad array of patients with MDS including those with greater transfusion burden and bone marrow dysfunction

Data are presented as of a data cutoff date of September 1, 2023.

a. Includes data for weeks 0-24 in mITT₂₄ patients; b. Defined as achieving modified IWG 2006 HI-E and/ TI; c. Modified IWG 2006 HI-E = mean increase in hemoglobin ≥1.5 g/dL (NT+LTB) or reduction in transfusion of ≥4 RBC units (HTB) over 8 weeks on treatment compared to 8-week pre-treatment period; d. TI-evaluable patients received at least 2 RBC units in the 8-week pre-treatment period;

Higher Hematologic Response Rates Observed in Patients with Baseline EPO <500 U/L

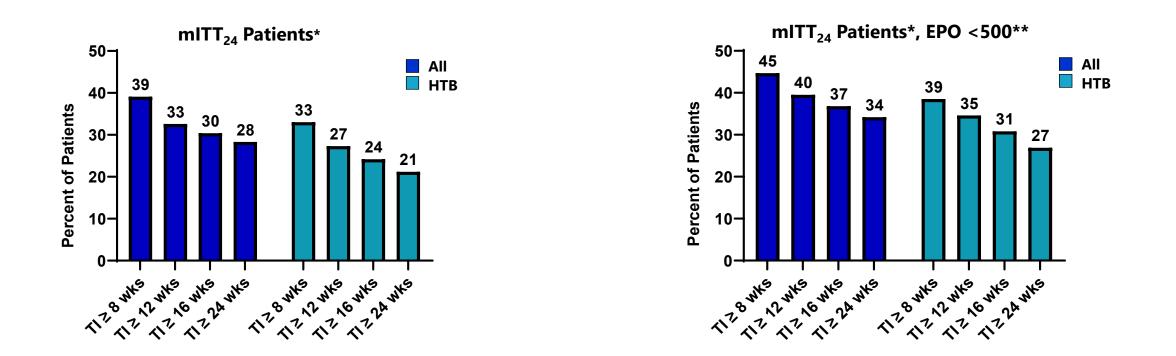

Responders/N (%)	mITT ₂₄ EPO<500 U/Lª		
Kesponders/N (76)	All (N=50)	HTB (N=26)	
Overall Response ^{a,b}	28/50 (56.0)	14/26 (53.8)	
Modified IWG 2006 HI-E ^c	26/50 (52.0)	14/26 (53.8)	
RS+	21/36 (58.3)	11/20 (55)	
non-RS	5/14 (35.7)	3/6 (50)	
TI ≥8 weeks ^d	17/38 (44.7)	10/26 (38.5)	
RS+	14/29 (48.3)	7/20 (35)	
non-RS	3/9 (33.3)	3/6 (50)	

- Studies in mainly LR-MDS patients suggest that the majority (~90%) of patients have serum EPO levels < 500 U/L¹
- EPO levels ≥500 U/L are associated with lower erythroid response rates across multiple treatments¹
- 9 patients in the mITT₂₄ population had baseline EPO levels ≥ 500 U/L:
 - 6/9 had non-RS MDS
 - 3/9 were reclassified by IPSS-M as having high or very-high risk disease

Data are presented as of a data cutoff date of September 1, 2023.

a. Includes data for weeks 0-24 in mITT₂₄ patients, excluding one patient with del5q MDS although their baseline EPO was <500 U/L; b. Defined as achieving modified IWG 2006 HI-E and/or TI; c. Modified IWG 2006 HI-E = mean increase in hemoglobin ≥1.5 g/dL (NT+LTB) or reduction in transfusion of ≥4 RBC units (HTB) over 8 weeks on treatment compared to 8-week pre-treatment period; d. TI-evaluable patients received at least 2 RBC units in the 8-week pre-treatment period 1. Park, S et al. Annals of Hematology. 2020.

Observed Rates of TI for ≥24 Weeks Support Durability of Response with KER-050 Treatment

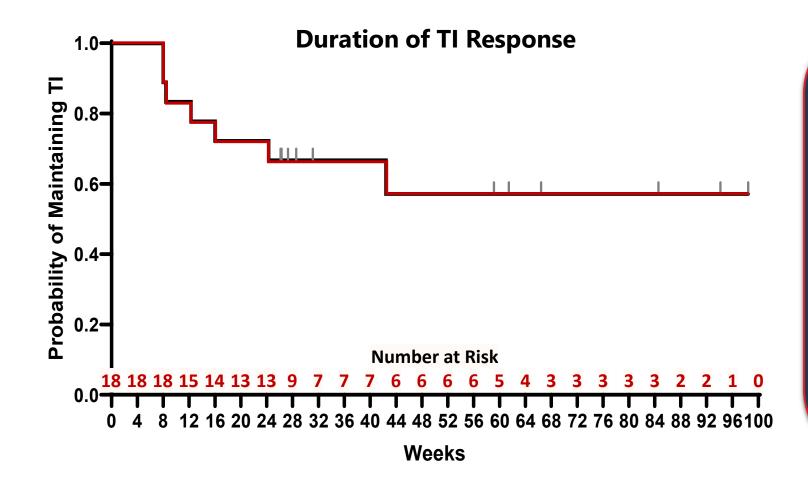

Durable TI was observed including in patients with HTB, and response rates were relatively higher in patients with baseline EPO < 500 U/L

Data are presented as of a data cutoff date of September 1, 2023. *During Weeks 0-48; **Excludes 1 patient with del5q MDS

Durable TI Responses Observed with KER-050 Treatment

18 participants in the mITT₂₄ population had TI ≥ 8 weeks

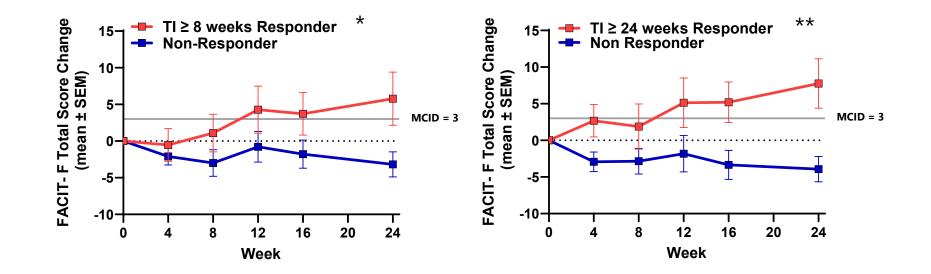

• 11/18 (61.1%) had HTB

- 13/18 (72%) had TI ≥ 24 weeks
- 11/18 (61.1%) had ongoing TI at time of data cut-off
 - Median baseline transfusion burden: 4 RBC units/8 weeks (range 2 to 11)
 - 6/11 (54.5%) had ongoing TI for > 52 weeks including participants who had received up to 11 RBC units/8 weeks at baseline
- <u>Median duration of response not</u> <u>reached</u> (range: 8 to 98 weeks)

Data are presented as of a data cutoff date of September 1, 2023.

Longest TI interval through KER-050 treatment for mITT₂₄ patients who achieved TI ≥8 weeks during weeks 0-24; Patients with ongoing response censored at time of cutoff (denoted by vertical lines)

Durable and Clinically Meaningful Improvements in FACIT-Fatigue Scores were Observed in TI Responders to KER-050

Health-related quality of life (HRQOL) is negatively impacted by MDS^{1,2} with fatigue identified as a critically important domain to assess in patients with MDS³

- Prolonged transfusion dependence is associated with significantly worse HRQOL and shorter overall survival³
- Evidence suggests that worse fatigue is associated with reduced survival in MDS⁴
- The FACIT-Fatigue scale is a validated measure of self-reported fatigue and its impact upon daily activities and function that has been widely used in MDS studies^{4,5}

Data are presented as of a data cutoff date of September 1, 2023.

Potential of KER-050 to Reduce Cardiac Stress in Exploratory Analysis

- In patients with LR-MDS, cardiovascular (CV) events represent a major cause of death possibly due to myocardial stress exacerbated by chronic anemia and iron overload in MDS¹⁻³; NT-proBNP is a biomarker of myocardial stress
- Activin A has been shown to play a pathophysiologic role in CVD^{4,5}, and has been associated with inflammation⁶, vascular and myocardial remodeling^{7,8}, myocardial infarction⁹ and severity of HF¹⁰
- Decreases in NT-proBNP were observed rapidly following initiation of dosing and were sustained for the majority of individuals regardless of erythropoietic response

Observed Decreases in NT-proBNP

Suggests KER-050 may ameliorate cardiac strain directly via inhibition of activin A and indirectly by improving anemia and reducing transfusion burden

Data are presented as of a data cutoff date of September 1, 2023.

Summary of KER-050 in MDS

In the ongoing Phase 2 clinical trial of KER-050 in LR-MDS, the majority of patients enrolled had HTB or MLD indicating a difficult-totreat trial population

KER-050 was generally well-tolerated as of the data cut-off date, with a safety profile consistent to that previously reported for this trial^{1,2}

Durable responses of transfusion independence were observed in a broad range of patients with LR-MDS, including those with HTB

- Analysis of patients with EPO < 500 U/L revealed improved erythroid responses across the trial population, including in patients with HTB or non-RS disease
- Transfusion independence, increases in hemoglobin, and increases in platelets were observed, supporting the potential for KER-050 to ameliorate ineffective hematopoiesis across multiple lineages in patients with MDS

Patients who achieved transfusion independence showed clinically meaningful improvements in FACIT-Fatigue scores indicating potential for KER-050 to improve quality of life in patients with LR-MDS

Observations from exploratory assessments of biomarkers:

- Sustained increases in bone specific alkaline phosphatase (BSAP) were observed with KER-050 treatment supportive of potential to improve the bone marrow microenvironment
- Several patients presented with elevated NT-proBNP at baseline, suggestive of increased myocardial stress
 - Rapid decreases with NT-proBNP were observed with KER-050 treatment in HI-E/TI responders and non-responders

Collectively, these results support advancing KER-050 into a Phase 3 registration trial in patients with LR-MDS

KER-050 (elritercept)

Investigational Treatment for Anemia and Thrombocytopenia in Patients with Myelofibrosis

Ongoing Phase 2 Open-Label Clinical Trial to Evaluate the Safety and Efficacy of KER-050 as Monotherapy or in Combination with Ruxolitinib in Participants with Myelofibrosis

Myelofibrosis

MF

Ð

MF is a rare cancer of the bone marrow in which the marrow is replaced by scar tissue and is not able to produce healthy blood cells

Clinical Consequences

MF is characterized by ineffective hematopoiesis, an enlarged spleen, bone marrow fibrosis and shortened survival. Both anemia and thrombocytopenia are negative prognostic indicators

Current Treatments

Currently, there are limited therapeutic options to address the MF-associated cytopenias. Patients not only often experience multiple disease-associated, but also treatment-emergent, cytopenias, including anemia and thrombocytopenia

ዅ፟፟፟፟፟ቝ፟ዅ፟ ቝ፟ዅ፟ቝ፟ዅ፟ቝ

Scope

In the United States, there are 16,000 to 18,500 patients living with MF and approximately 3,000 newly diagnosed each year

Cytopenias including treatment and disease related severe anemia

Progressive disease leading to splenomegaly, bone marrow fibrosis and AML

Severe fatigue and decreased quality of life

Created with BioRender

Impact of MF

Ongoing Phase 2 Clinical Trial to Evaluate KER-050 as Monotherapy or in Combination with Ruxolitinib in Patients with MF

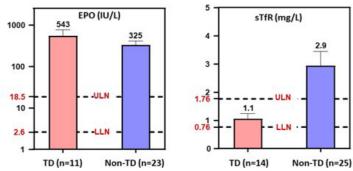

RESTORE Part 1: Dose Escalation Part 2: Dose Expansion Arm 1A: KER-050 Monotherapy Anemia, relapsed/refractory/intolerant n=18-30 to JAK inhibitor(s) or ineligible for JAK inhibitor(s) Dose Level 4; 4.5 mg/kg Dose Level 3; 3.0 mg/kg Arm 2A: KER-050 Monotherapy Dose Level 2; 1.5 mg/kg RP2D n=25 Anemia, relapsed/refractory/ Dose Level 1; 0.75 mg/kg intolerant to JAK inhibitor(s) Arm 1B: KER-050 + Ruxolitinib n=18-30 Anemia, on ruxolitinib ≥ 8 weeks, stable dose for \geq 4 weeks Dose Level 4; 4.5 mg/kg Arm 2B: KER-050 + Dose Level 3; 3.0 mg/kg **Ruxolitinib** Dose Level 2; 1.5 mg/kg RP2D n=25 Anemia, on ruxolitinib ≥8 weeks, stable dose for Dose Level 1; 0.75 mg/kg ≥4 weeks

Following recommendation by the Safety Review Committee, dosing for Part 2 of this trial was initiated at a starting dose of 3.75 mg/kg, with an opportunity to dose escalate to 5.0 mg/kg based on individual titration rules, in both combination and monotherapy arms

RESTORE Baseline Demographics

Characteristic	Monotherapy (N=21)	Combination (N=20)	Total (N=41)

KER-050 Was Generally Well-Tolerated in Patients with Significant Disease Burden

TEAEs mild to moderate

Treatment-related TEAEs relatively infrequent

Two had Grade 3 or higher worsening cytopenias

One Dose Limiting Toxicity in Part 1

- Increased Hgb ≥2 g/dL in dose Level 2 cohort of monotherapy arm
- No associated AE, Hgb within normal limits

Three TEAEs* leading to death, all deemed unrelated to study therapy

Category, n (%)	Monotherapy (N=21)	Combination (N=20)	Total (N=41)
Any TEAE	20 (95.2)	19 (95.0)	39 (95.1)
Most frequent TEAEs (≥10%* of participants)			
Diarrhea	3 (14.3)	6 (30.0)	9 (22.0)
Thrombocytopenia	5 (23.8)	2 (10.0)	7 (17.1)
Asthenia	5 (23.8)	1 (5.0)	6 (14.6)
Fatigue	3 (14.3)	3 (15.0)	6 (14.6)
Pyrexia	5 (23.8)	1 (5.0)	6 (14.6)
DLTs	1 (4.8)	0	1 (2.4)
SAEs	7 (33.3)	8 (40.0)	15 (36.6)
KER-050-related TEAE	6 (28.6)	4 (20.0)	10 (24.4)
Ruxolitinib-related TEAE	N/A	6 (30.0)	6 (14.6)
KER-050-related TEAE of Grade ≥ 3	1 (4.8)	0	1 (2.4)
Ruxolitinib-related TEAE of Grade ≥ 3	N/A	1 (5.0)	1 (2.4)
TEAE leading to KER-050 discontinuation	4 (19.0)	3 (15.0)	7 (17.1)
TEAE leading to ruxolitinib discontinuation	N/A	2 (10.0)	2 (4.9)
TEAE Leading to Death	1 (4.8)	2 (10.0)	3 (7.3)

KER-012

Investigational Treatment for Pulmonary Arterial Hypertension (PAH) and for Cardiovascular Disorders

Ongoing Randomized, Phase 2, Double-blind, Placebo-Controlled Clinical Trial to Evaluate the Safety and Efficacy of KER-012 in Combination with Background Therapy in Adult Participants with Pulmonary Hypertension

•1•[•

Imbalances in TGF-β Superfamily Signaling Underlies Vascular Remodeling in PAH

PAH is a debilitating disorder characterized by elevated pulmonary vascular resistance due to increased vascular smooth muscle cell proliferation and inflammation

- This results in diminished oxygenation, impaired cardiac output, and right ventricle (RV) overload
- Despite current treatment options, the 5-year survival remains only slightly above 50%
- PAH is associated with imbalanced TGF-β superfamily signaling, including insufficient bone morphogenic protein (BMP) signaling and increased signaling by activins and GDFs
 - A third-party Phase 3 clinical trial of sotatercept¹ demonstrated the importance of the TGF-β superfamily in patients with PAH
 - Maximum dose of sotatercept in PAH limited to 0.7 mg/kg in the clinical trial due to increased hemoglobin observed in earlier-phase clinical trials^{2,3}

Pulmonary Arterial Hypertension Thickened Vasculature

Imbalanced TGF- β signaling results in \uparrow myogenic & fibrogenic differentiation

KER-012 is a modified activin receptor IIB ligand trap:

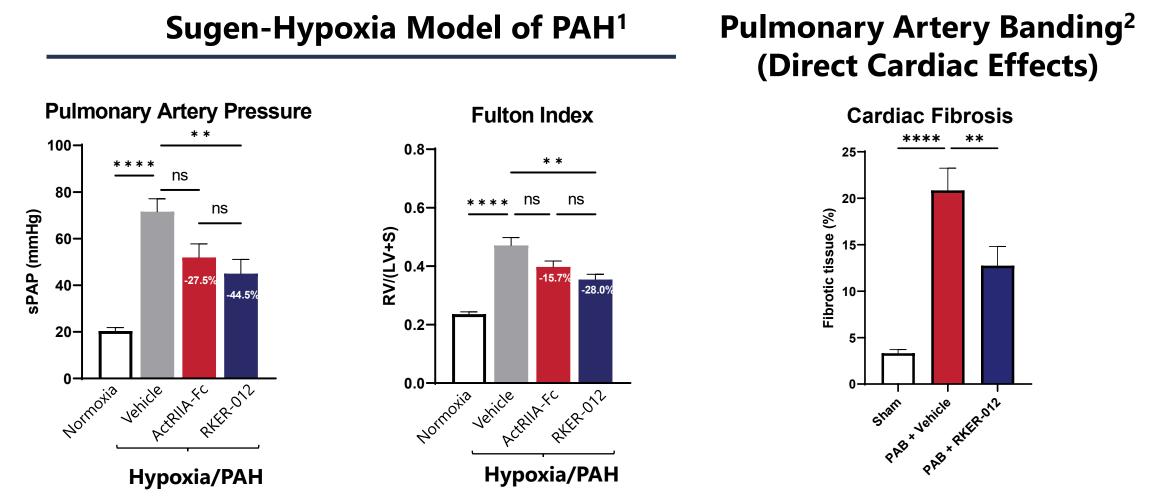

Designed to rebalance TGF-β superfamily signaling

1. K. Babbs, et al. Am J Respir Crit Care Med 2022;205:A5776; 2. Babbs K, et al. Am Heart Association Scientific Sessions 2021; RKER-012 = Research KER-012 fused with Fc region of murine IgG1

Observed KER-012 Profile Supports Therapeutic Rationale in PAH

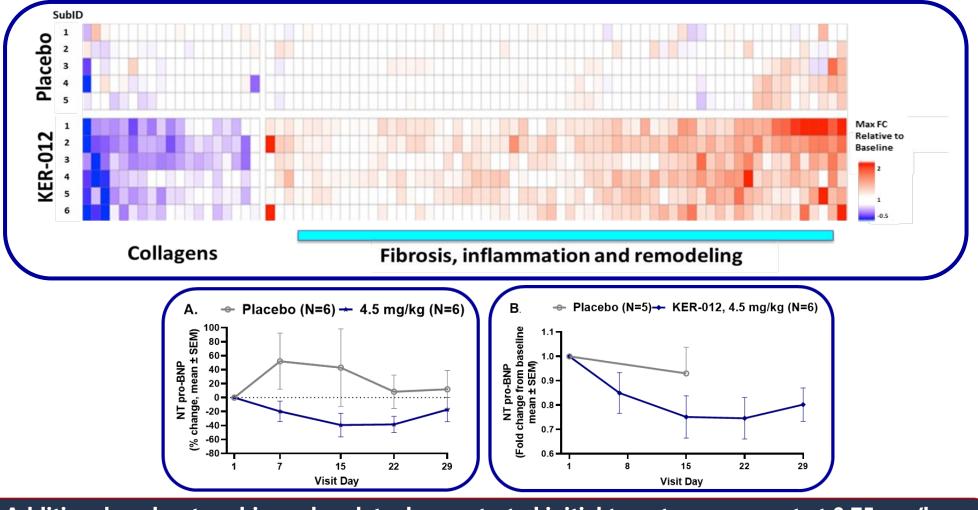

Keros completed a randomized, double-blind, placebo-controlled, two-part Phase 1 clinical trial to evaluate single and multiple ascending doses of KER-012 in healthy volunteers.

• The primary objectives of this trial were safety, tolerability and pharmacokinetics.

PAH Domain	Preclinical Data	Phase 1 Clinical Trial ^{1,2}
MOA & Ligand Specificity:	 Strong activin/GDF binding observed Observed to be BMP-sparing vs. ActRIIA-Fc 	 We believe PD data support potential for maximal target engagement with doses in Phase 2
Fibrosis & Inflammation:	↓ Inflammation ↓ Fibrosis	 ✓ Pro-inflammatory biomarkers ↑ Anti-inflammatory biomarkers ✓ Pro-fibrotic biomarkers ↑ Anti-fibrotic biomarkers
CV & Hemodynamics:	 ✓ Smooth muscle hypertrophy ✓ Pulmonary arterial pressure ✓ Right & left ventricular hypertrophy ✓ Cardiac fibrosis (direct) ✓ Ventricular dysfunction biomarkers 	earrow Ventricular dysfunction biomarkers $ earrow$ Remodeling biomarkers
Erythropoiesis (Hb/RBCs):	No increase observed	No clinically meaningful changes observed
Safety & Tolerability:	N/A	 Generally well tolerated up to 4.5 mg/kg (multiple doses) in Part 2 of the trial AEs generally mild

1. Natarajan H., et al. American Society for Bone and Mineral Research 2022 Annual Meeting; 2. Natarajan H., et al. 2023 American Thoracic Society International Conference

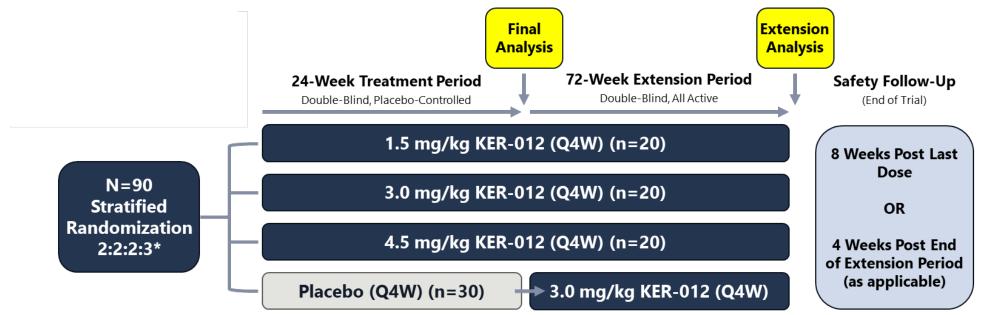

KER-012 Altered Expression of Serum Proteins Associated with Inflammation and Extracellular Matrix Remodeling and Lowered NT-proBNP levels

Additional exploratory biomarker data demonstrated initial target engagement at 0.75 mg/kg and maximum target engagement at 4.5 mg/kg

Natarajan H, et al Am J Respir Crit Care Med 2023;207:A1187

TROPOS Trial: Global Phase 2 Clinical Trial of KER-012 in Patients with PAH

*Approximately 90 patients diagnosed with PAH and on stable PAH background therapy will be randomized and assigned in a 2:2:2:3 ratio to the 1.5 mg/kg, 3.0 mg/kg, and 4.5 mg/kg KER-012 doses and placebo treatment arms.

Primary Objective:

 To evaluate the effect of KER-012 on hemodynamics compared to placebo in participants on background PAH therapy

Primary Endpoint:

 Change from baseline in pulmonary vascular resistance (PVR) at Week 24

Key Secondary Objective:

 To evaluate the effect of KER-012 on exercise capacity compared to placebo in participants on background PAH therapy

Key Secondary Endpoint:

 Change from baseline in 6-minute walk distance at Week 24

Open-Label Biomarker Phase 2 Clinical Trial of KER-012

Ongoing open-label, exploratory Phase 2 clinical trial evaluating KER-012 in adult patients with chronic heart failure with preserved ejection fraction (HFpEF) or with reduced ejection fraction (HFrEF)

The primary objective of this trial is to evaluate the tolerability and safety of KER-012 administered as multiple subcutaneous doses once every four weeks in patients with chronic heart failure

In addition, this trial will explore pharmacokinetics, pharmacodynamic effects and NT-proBNP

Trial Design:

- Six patients with HFpEF will be dosed with 4.5 mg/kg of KER-012 once every four weeks for up to 24 weeks
- Once all six patients have completed Study Day 29, the preliminary safety data will be reviewed by the Safety Review Committee
- Based on the outcome of this review, six patients with HFrEF are expected to be enrolled, and these patients will also receive 4.5 mg/kg of KER-012 once every four weeks for up to 24 weeks
- After the last dose of KER-012, patients will enter into a safety follow-up period for eight weeks

Keros expects to announce initial data from this trial in the second half of 2024

Obesity & Neuromuscular Franchise

✓

KER-065, a Novel Activin Receptor Ligand Trap for the Treatment of Obesity and Neuromuscular Disorders

Keros' preclinical library of activin receptor ligand traps contains more than 40 distinct molecules containing sequences from ActRIIA and ActRIIB

 KER-065 is the 3rd molecule selected from our preclinical library for clinical development

KER-065 is a modified activin receptor IIA (ActRIIA) and activin receptor IIB (ActRIIB) ligand trap

► ~50% amino acids derived from each activin receptor

KER-065 is designed to bind to the negative regulators of muscle growth, activin A and myostatin, to increase skeletal muscle without an increase in red blood cells

 Reduced binding to bone morphogenic proteins to avoid the vascular/bleeding observed with ActRIIb-Fc derived from the native sequence

Domain	Potential Effect ¹	
Muscle	Increase in skeletal muscle Does not increase smooth muscle and cardiac muscle	
Fat	Decreases fat mass	
Bone	Increases bone mineral density	
Fibrosis and Inflammation	Reduce fibrosis and inflammation via Activin A inhibition	
Cardiac	Improve cardiac function via Activin A inhibition	

1. Observed in preclinical studies.

KER-065: *Neuromuscular Diseases*

KER-065: Neuromuscular Diseases

Muscle loss can occur as a consequence of many factors, including neuromuscular disease, disuse, aging and as a side effect of some therapies

In neuromuscular diseases, muscle loss can result in muscle weakness and, with increased severity, can lead to loss of ambulation, reliance on a wheelchair, swallowing difficulties, respiratory muscle weakness and death

 Decline in muscle mass can also be associated with secondary osteoporosis and metabolic consequences, including obesity and insulin resistance

TGF-β pathway signaling regulates skeletal muscle, fat and bone, and activins and myostatin are powerful negative regulators of skeletal muscle

In preclinical studies, KER-065 showed high affinity for and potent inhibition of ligands involved in the regulation of muscle and bone homeostasis. Additionally, the research form of KER-065 (RKER-065):

- Increased muscle mass, muscle function and bone mass in wild-type mice
- Increased muscle mass, grip strength and trabecular bone in a mouse model of DMD¹
- Increased muscle mass, improved muscle function and prevented bone loss in prednisolone-treated mice

1. Nathan, R., et al. 27th International Hybrid Annual Congress of the World Muscle Society

Treatment with RKER-065 Led to Higher Utrophin Levels in Mouse Model of DMD

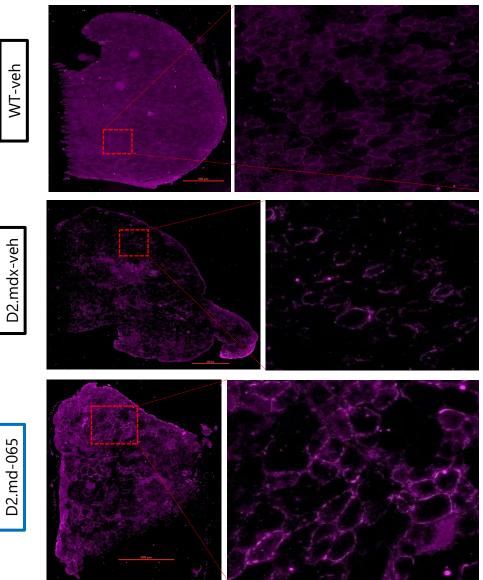

Muscle lacking dystrophin is easily damaged during the process of contraction

Many approaches have been utilized to stabilize the muscle and provide resistance to contractile-induced damage

- Antisense oligonucleotides to trigger exon skipping, restore the mRNA reading frame, and allow production of a truncated dystrophin protein
- Gene therapy with mini and micro dystrophin
- Increase expression of utrophin (a functional analog of dystrophin)

Treatment with RKER-065 in a mouse model of DMD led to:

 Increased expression of utrophin in muscle fibers, potentially contributing to the observed increased strength¹

KER-065: *Obesity*

- We believe preclinical data suggests KER-065 has the potential to improve body composition by increasing muscle mass and decreasing fat mass alone or in combination with glucagon-like peptide-1 (GLP-1) receptor agonists
- By targeting activin A, KER-065 has the potential to directly reduce inflammation and fibrosis, the processes resulting in the development of cardiometabolic diseases
- Potential for infrequent (monthly) subcutaneous dosing

\$ 5 4

Obesity is a Growing Public Health Crisis

Obesity is a global public health crisis, with over 1.9 billion overweight adults worldwide in 2016, 650 million of which were considered to be obese

Obesity increases risk of hypertension, dyslipidemia, type 2 diabetes, certain cancers and cardiometabolic diseases

According to the Centers for Disease Control and Prevention, the estimated annual medical cost of obesity in the U.S. was nearly \$173.0 billion in 2019 dollars

Current GLP-1 RA Treatment Landscape for Obesity

GLP-1 receptor agonists (GLP-1 RAs) have recently been approved for the treatment of obesity

 Treatment with GLP-1 RAs led to 15%-21% mean weight loss^{1,2}, reductions in blood lipids, improvements in glycemic control and better cardiac outcomes³

Weight loss is due to reduction in fat mass and reduction in lean body mass as a result of treatment

 An estimated 25%-40% of total body weight loss mediated by GLP-1 RA treatment may be attributed to loss of lean muscle mass^{1,2}

Majority of body weight loss is regained after stopping GLP-1 RA treatment

 In extension analyses of 327 participants, participants regained 67% of prior weight loss one year after withdrawal of once-weekly subcutaneous GLP-1 RA treatment and lifestyle intervention⁴

Need for treatment options that:

- Ameliorate the loss of lean mass due to GLP-1 RA treatment and obesity
- Provide long-term treatment option for maintenance of weight loss
- Directly impact disease processes that contribute to cardiometabolic diseases

Well-Established Rationale for Targeting Activin and Myostatin Signaling as Treatment for Obesity and Associated Cardiometabolic Disease

Muscle Tissue

Inhibition of activin A and myostatin increase muscle hypertrophy and strength

Adipose (Fat) Tissue

- Activin A, activin B, activin E and GDF3 signal via ActRII¹ and inhibit differentiation of cells to energyconsuming "brown" fat cells
- Inhibition of these ligands increases energy expenditure by adipocytes²

Cardiac Disease

Activin A and follistatin-like 3 are increased in patients with heart failure³

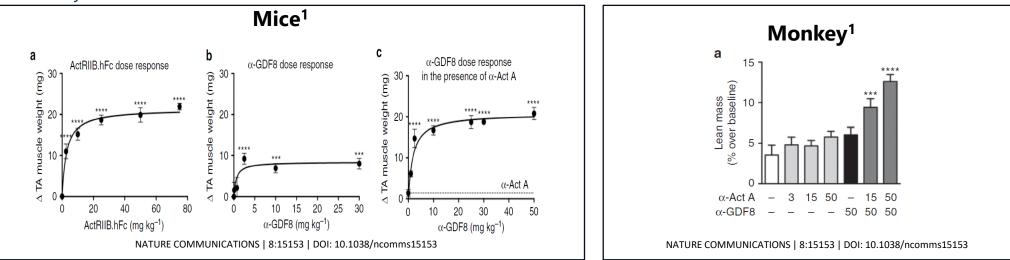

Clinical proof-of-concept established in third-party clinical trials, with multiple approaches targeting the TGF-β superfamily pathway

- Selective neutralizing antibodies to myostatin and activin A
- Neutralizing antibodies targeting ActRIIA and ActRIIB
- ActRIIB-Fc ligand trap that binds multiple ligands, including activin A and myostatin

Inhibition of Both Activin A and Myostatin is Required to Maximally Increase Skeletal Muscle in Mice and Monkeys

In third-party preclinical studies, selective inhibition of myostatin (GDF-8) or activin A resulted in small increases in muscle mass in rodents and non-human primates¹

- Targeting multiple ligands in the TGF-β superfamily produced the largest increase in skeletal muscle¹
- More than two times increase in skeletal muscle with anti-myostatin and anti-activin A combination or ActRIIB-Fc treatment compared to anti-myostatin treatment alone¹

ActRIIB-Fc ligand trap and neutralizing antibodies targeting ActRIIA and ActRIIB showed similar increases in muscle^{2,3}

ActRIIB-Fc subcutaneous administration

Anti-ActRIIA/ActRIIB such as bimagrumab are intravenous administration

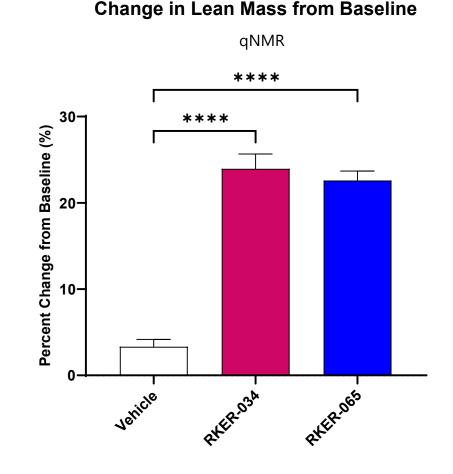

Keros' ActRII ligand traps are designed to inhibit myostatin and activin A to potentially produce a maximal increase in skeletal muscle

Latres, E., Mastaitis, J., Fury, W. *et al.* Activin A more prominently regulates muscle mass in primates than does GDF8. *Nat Commun* 8, 15153 (2017). <u>https://doi.org/10.1038/ncomms15153</u>

Corporate Presentation

Equivalent Increase in Lean Mass Observed in Obese Mice with RKER-034 and RKER-065

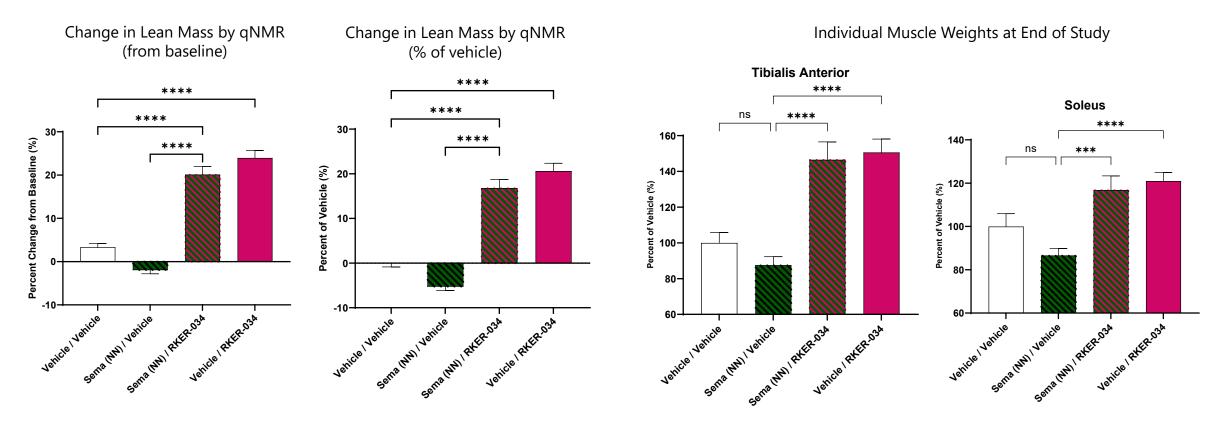

- RKER-034, a preclinical asset from our proprietary library of ActRII ligand traps, is closely related to KER-065. Similar to KER-065, RKER-034 is designed to bind to and inhibit multiple TGF-B ligands, including activin A and myostatin (GDF8), and has increased skeletal mass and bone in preclinical studies
- Mice fed sugar- or fat-enriched diets for a long time end up with metabolic diseases like humans: obesity, high blood sugar, high blood pressure, insulin resistance, heart failure and liver disease¹
- Administration of either RKER-034 or RKER-065 (10 mg/kg, twice weekly for four weeks) in obese mice on a high calorie diet resulted in equivalent increases in lean mass

RKER-034 Preserved Lean Mass in Obese Mice Treated with Semaglutide

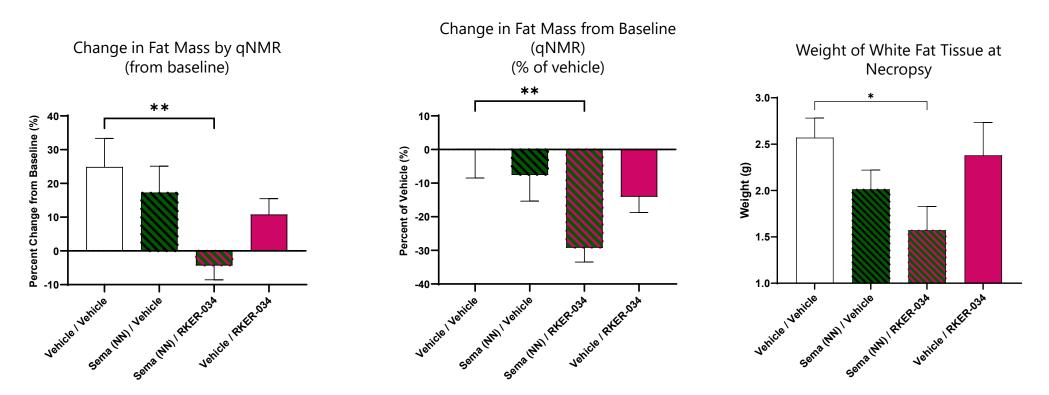

- Obese mice treated with semaglutide (sema; 0.041 mg/kg twice weekly), a GLP-1 RA, lost lean mass
- Administration of RKER-034 not only preserved, but also increased lean mass in sema-treated obese mice
- Observed increase in lean mass with combination therapy (0.041 mg/kg sema and 10 mg/kg RKER-034) was equivalent to RKER-034 treatment alone

Corporate Presentation

Treatment Enhanced Fat Loss with Semaglutide

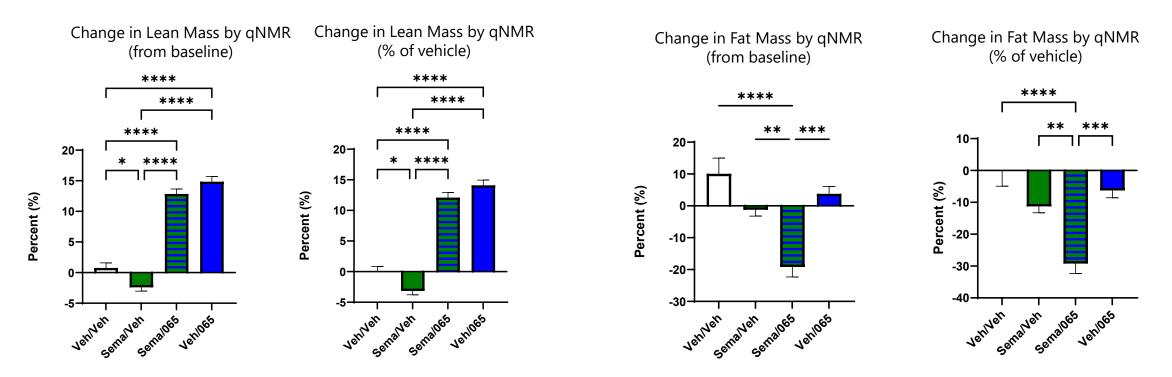

- Obese mice on high calorie diet continued to gain weight and fat mass
- Treatment with sema (0.041 mg/kg twice weekly) resulted in reduced fat gain compared to untreated obese mice
- Treatment with RKER-034 (10 mg/kg twice weekly) reduced fat gain equivalent to sema
- Treatment with 10 mg/kg RKER-034 and 0.041 mg/kg sema not only reduced the fat gain, but lost fat mass compared to baseline

RKER-065 Preserved Lean Mass and Enhanced Fat Loss in Obese Mice Treated with Semaglutide

- Obese mice were treated for two weeks with vehicle, sema (0.082 mg/kg twice weekly) or RKER-065 (10 mg/kg twice weekly) in combination with sema or monotherapy
- Treatment with sema reduced fat mass and resulted in loss of lean mass compared to untreated obese mice
- Administration with RKER-065 increased lean mass and reduced fat mass compared to untreated obese mice
- Combination treatment with semaglutide and RKER-065 increased lean mass compared to untreated obese mice and had a synergistic loss in fat mass

Summary of Preclinical Studies in the Diet Induced Mouse Model of Obesity

Treatment with RKER-065 and RKER-034 showed similar increases in skeletal muscle

As a single treatment, both RKER-065 and RKER-034 increased lean (muscle) mass and reduced fat mass

Combination treatment with RKER-034 and sema led to:

- Reversal of lean mass mediated by sema
- Enhanced loss of fat mass through increased energy expenditure from increased lean mass

Based on this preclinical data, we believe that KER-065 has the potential to treat obesity as a standalone therapy and in combination with GLP-1 RAs, by increasing muscle mass and decreasing fat mass

KER-065 Phase 1 Clinical Trial in Healthy Volunteers

Primary objectives of this Phase 1 clinical trial are to evaluate safety, tolerability and pharmacokinetics of single and multiple ascending doses of KER-065

The multiple ascending dose portion of this trial will enroll patients with elevated body mass index (BMI) of 27-33 to evaluate KER-065's effect on lean mass, fat mass and bone mineral density

Imaging by DXA and MRI

Additional exploratory biomarkers will be included to examine KER-065's pharmacologic effect on:

- Biomarkers of bone formation and resorption
- Adipokines
- NT-proBNP, a marker of cardiac stress
- Markers of fibrosis

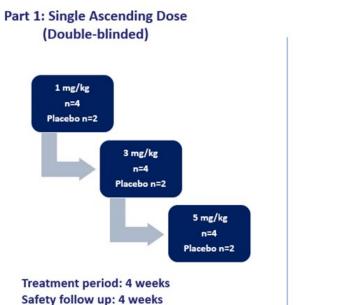

We believe this trial has the potential to provide biologic proof-of-concept to support initiation of a Phase 2 proof-of-concept clinical trial in patients with obesity

- Informs potential development in neuromuscular indications such as Duchenne muscular dystrophy (DMD)
 - Patients on the DMD standard of care, glucocorticoids, have higher BMI, muscle loss, insulin resistance and accelerated bone loss
- We expect to announce data from this Phase 1 clinical trial in Q1 2025

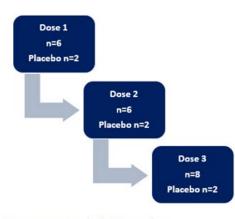

KER-065 Phase 1 Trial Design

Phase 1 Clinical Trial Design

Single subcutaneous dose

Part 2: Multiple Ascending Dose (Double-blinded)

Treatment period: 12 weeks Safety follow up: 4 weeks Three subcutaneous doses (28 days apart)

Primary Objective

• Evaluate the tolerability and safety of KER-065

Secondary Objective

• Evaluate the PK of KER-065

Exploratory Objectives

- Assess the pharmacodynamic (PD) effect on bone, adipose, muscle, cardiac tissue, and fibrosis of KER-065
- Inclusion of overweight/obese volunteers in MAD to enhance ability to detect change in PD effects

Study Subjects:

- Healthy volunteers
- ► Males 18-55 years of age
- Body Mass Index:
 - ► SAD: 18.5 30
 - ► MAD: 27 33

Proprietary Discovery Approach

Proprietary Discovery Approach

We have developed a proprietary library of ActRII ligand traps by combining sequences from ActRIIA and ActRIIB

- We have engineered molecules that are designed to have the therapeutic properties of either or both parent molecules
- Our ActRII program has produced a broader pipeline of engineered ligand traps and currently contains more than 20 unique variants in preclinical development
- KER-065 was nominated out of this proprietary library of ActRII ligand traps for clinical development
- KER-034 is another ActRII ligand trap in our preclinical pipeline closely related to KER-065

This discovery approach has the potential to identify additional molecules with differentiated profiles from existing third-party products and product candidates

Pipeline of preclinical assets: musculoskeletal; obesity; other undisclosed indications

Anticipated Key Milestones

- Engage with regulators on design of Phase 3 MDS trial
- Announce additional data from Part 2 of Phase 2 MDS trial
- Announce additional data from Phase 2 MF trial

KER-012

- Provide update on enrollment of Phase 2 PAH TROPOS trial
- Announce initial data from Phase 2 open-label biomarker trial in patients with chronic
 H2 2024 heart failure with preserved ejection fraction and in such patients with reduced ejection fraction

KER-065

Announce data from Phase 1 healthy volunteer trial
